

Description

Discover the perfect combination of security, technology and durability with LUX electronic locks for hotels, specially designed to meet the demands of the hospitality sector.

With a solid body and handles made of AISI 304 stainless steel, these locks ensure superior resistance even in high-humidity environments, thanks to the tropicalized electronic circuit that prevents oxidation. Works with 4 AAA batteries.

Equipped with advanced RFID technology, they offer multiple access control options, including the innovative Connect system that allows electronic keys to be sent directly to guests' mobile phones via management software, ensuring a practical and secure experience.

The anti-tamper handles feature a free-turn mechanism that prevents forced entry attempts and are reversible for left or right-hand opening. The system also includes EEPROM memory that keeps all settings active even after battery replacement and a green indicator light that confirms each operation performed on the lock.

Detailed control through the software allows for logging up to one thousand different events, including openings with the mechanical emergency key using a European profile cylinder with master key, always ensuring an extra layer of security for your establishment.

Ideal for managers and purchasing departments of modern hotels that value innovation combined with reliability, these solutions represent a smart investment in the protection of your guests and property.

Raise the standard of your hotel management with this robust and versatile solution, designed specifically to maximise operational convenience without compromising security or the aesthetics of your facilities.
